THE COLLaborATION OF EXERCISE PHYSIOLOGISTS AND DIETITIANS IN CHRONIC DISEASE MANAGEMENT

A Joint Position Statement of Exercise & Sports Science Australia (ESSA) and the Dietitians Association of Australia (DAA).

Approved by the Boards of ESSA and DAA March 2008, revised June 2014.

Introduction

Considerable knowledge has accumulated over the last two decades concerning the significance of exercise and nutrition interventions in the treatment of a large number of chronic diseases. It is well established that the costs associated with these diseases are placing a substantial burden on the Australian healthcare system and that appropriate exercise and nutrition interventions can reduce these costs. Accredited Exercise Physiologists (AEPs) and Accredited Practising Dietitians (APDs) are widely recognised as the highest qualified health professionals in the design and delivery of exercise and nutrition services respectively. Empirical evidence supports exercise physiology and dietetic services as an essential component in the management of chronic disease in collaboration with a team of medical and other allied health professionals.

In response to the growing emphasis on exercise physiology and dietetic services in the management of chronic disease, the Exercise & Sports Science Australia (ESSA) and the Dietitians Association of Australia (DAA) have developed a Position Statement for the collaboration of AEPs and APDs in the management of chronic disease. Improving collaboration between the professions, enhancing mutual respect and understanding, and advancing patient outcomes is the tenet underpinning this position statement.

What is an Accredited Exercise Physiologist?

An Accredited Exercise Physiologist (AEP) describes a university-trained and ESSA accredited exercise specialist who possesses the knowledge, skills and competency to design and deliver general physical activity advice and clinical exercise prescription for apparently healthy persons and for those persons with chronic and complex diseases. The aim of the intervention is to facilitate long-term behaviour change by encouraging the self-management of health through exercise and other lifestyle modifications, with a view to preventing and treating disease.

What is an Accredited Practising Dietitian?

An Accredited Practising Dietitian (APD) describes a university-trained and DAA accredited dietitian and nutritionist who possesses the knowledge, skills and competency to provide expert nutrition and dietary advice. APDs design and deliver Medical Nutrition Therapy (MNT) which forms an integral part of the management of people with chronic and complex diseases. The aim of the intervention is to facilitate long term behaviour change by encouraging the self-management of health through nutrition, diet and other lifestyle modifications, with a view to preventing and treating disease.
General physical activity advice and general nutrition advice

General physical activity advice provides general guidelines for physical activity suitable for most people, including those with solitary and uncomplicated chronic disease with a view to improving general health and wellbeing and may be delivered by both AEPs and APDs (e.g. Australia’s Physical Activity and Sedentary Behaviour Guidelines).

General nutrition advice provides general guidelines for healthy eating and covers a range of nutrition topics suitable for most people but is not sufficient for those who require specific nutrition therapy as part of the management of their chronic disease. General nutrition advice may be delivered by both AEPs and APDs (e.g. Australian Dietary Guidelines).

Clinical exercise prescription and medical nutrition therapy

Exercise prescription and Medical Nutrition Therapy are designed to directly target an individual’s clinical presentation with a secondary aim of improving general health and wellbeing.

Clinical exercise prescription builds on general physical activity advice and is developed and delivered by AEPs. It involves individualised assessment, exercise advice, prescription, behavioural change counselling and support for people with chronic and/or complex disease(s).

Clinical exercise prescription is evidence based and may include stamina and endurance, cardiorespiratory and/or resistance exercise prescription and support for improving clinical diagnosis (e.g. cardiopulmonary diseases, neurological disorders or metabolic conditions). It may include prescription and support for improving symptoms that limit activities of daily living (e.g. shortness of breath and fatigue) or increasing incidental exercise, balance, agility, coordination and strategies for reducing sedentary behaviours. The prescription would incorporate an individualised combination of these modalities which would be balanced with patients’ goals, readiness to change, knowledge, skills and access to resources.

Medical nutrition therapy is a clinical intervention delivered by APDs. This intervention builds on general nutrition advice to achieve improved clinical and health outcomes appropriate to disease status (e.g. HbA1c, renal function etc) through nutrition assessment, dietary advice, knowledge and skill development and behavioural counselling.

Medical nutrition therapy is evidence based and includes a detailed individualised nutrition assessment, setting individual goals and priorities, practical dietary advice and counselling with follow-up for the purpose of disease management to improve quality of life. The advice and counselling provided takes into account the patients’ goals, readiness to change, knowledge, skills and access to resources.

Fostering interprofessional collaboration

ESSA and the DAA recommend the following in order to foster quality interprofessional collaboration:

- develop an active and interdependent partnership with health professionals in your area;
- make a commitment to understand the skills, knowledge and competencies of other health professions and professionals;
- collaboratively determine systems for streamlined cross referral and communication with other medical and allied health professionals involved in the management of your patients;
- organise joint professional development opportunities (e.g. workshops, seminars, case discussions);
- use information technology to enhance interprofessional practice;
- remind clients and patients of the value of both services when used concurrently.
# Model of Collaboration - Diabetes Example

## Common Assessment

### Assessment
- Medical history
- Chronic disease history e.g. diabetes
- Previous care/education
- Biomedical profile e.g. (lipids/HbA1c/BP)
- Anthropometry
- Current activity level
- Smoking/alcohol status
- Medications
- Current self care
- Special needs

### Behavioural History & Readiness for Change
- Motivational interviewing
- Readiness for change
- Goal setting
- Barriers and enablers to change with respect to diet & exercise

## Profession Specific Assessment

### General Exercise History
- Current or previous leisure time activity
- Occupational, household, incidental activity
- Have they seen an AEP?

### General Diet History
- Dietary habits
- Regular eating patterns
- Core food groups
- Have they seen an APD?

### Detailed Diet History
- Previous APD input?
- Previous dietary modifications/hx
- Detailed eating pattern
- Food types/brands
- Detailed serving sizes
- Food frequency
- Cooking methods/skills
- Limitations/practical issues
- GIT conditions
- Food insecurity?

### Detailed Exercise History
- Previous AEP input?
- Previous exercise experience
- Contraindications or barriers to exercise
- Particular consideration to cardiovascular, metabolic, neurological or musculoskeletal conditions that may affect exercise capacity/maintenance
- Pre-exercise screening & risk factor stratification
- Measurement of physiological parameters
- Exercise enablers - the factors that have assisted the individual engage in an exercise program

## Professional Partnership, Cross Referral or Joint Program Delivery Model

### Medical Nutrition Therapy
- Detailed eating pattern including timing of meals
- Food types/brands
- Detailed serving sizes and amounts, frequency
- Foods to avoid or limit
- Cooking methods/skills
- Practical solutions
- Reducing the risk of complications (acute & chronic)
- Treating complications e.g. hypoglycaemia
- Eating before and after exercise
- Provision of appropriate health information and resources

### Diabetes Specific Considerations
- Glycaemic index and glycaemic load
- Weight loss
- Hyperlipidaemia and hypertension
- Other diabetes complications

### Clinical Exercise Prescription
- FITTA (Frequency, Intensity, Time, Type, Adherence)
- Instruction/skill acquisition/progression
- Home, gym or AEP Practice support
- Pharmacological exercise interactions
- Overcoming mobility limitations
- Provision of appropriate health information and resources
- To design an exercise program with realistic and achievable goals

### Diabetes Specific Considerations
- Neuropathy (balance, wound risk)
- Claudication management
- Cardiovascular (eg. autonomic neuropathy)
- Education and guidance to reduce risk of adverse events such as exercise-induced hypoglycaemia and dehydration
- Other diabetes complications

## Schedule Review and Facilitate Referral
